M7PFUdA & M9PFNA

Various analytical methods have been employed for the analysis of perfluorinated environmental contaminants over the past few years. As the knowledge surrounding this class of compounds has grown and the number of mass-labelled standards available to laboratories steadily increased, the accuracy of the results obtained has improved. This illustrates the importance of utilizing as many relevant labelled standards as possible when analyzing for low level contaminants in complex matrices. The impact of using mass-labelled surrogates on the precision and accuracy of data is significant and applicable to any analytical method. With this in mind, **Wellington** has synthesized two new perfluorinated reference standards **M7PFUdA** and **M9PFNA** to complement our existing MPFUdA and MPFNA standards.
