**NEW PRODUCT****Mass-Labelled Fluorotelomer Sulfonate****M2-10:2FTS**

In recent years, restrictions on the use of perfluorooctanesulfonic acid (PFOS) has led to the use of fluorotelomer sulfonates (FTS) in many industrial and commercial applications. Unfortunately, studies have indicated that this alternative class of PFAS may have similar persistence, bioaccumulation potential, and toxicity. Wide-spread use of FTS in aqueous film-forming foams (AFFFs), surface treatment agents, and mist suppressant products has resulted in higher levels being measured in contaminated soil and drinking water. As landfill leachate containing FTS enters the environment, it has been shown that other PFAS, such as perfluoroalkylcarboxylic acids, are formed through biotransformation which further increases the importance of environmental monitoring. As a result, analytical PFAS reference methods now often include FTS in their analyte list.

To facilitate the quantitative analysis of **10:2FTS**, **Wellington** has prepared a certified mass-labelled reference standard for this compound (**M2-10:2FTS**) that complements our existing selection of native and mass-labelled fluorotelomer sulfonates.
